                                                                                                                                                                                                                                                                                          ö
                                                                                                This is the nucleotide sequence bimolecular ribozyme RzA fragment. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to an ucleid acid enzyme (e.g. deleaR2P1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate sequence. The enzyme of the invention is used to cleave a substrate with the enzyme. The enzyme to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                              Trans-acting antigenomic delta ribozyme, deltaRzP1.1 nucleotide sequence.

                                                                                                                                                                                                                                                                  This is the nucleotide sequence of ribozyme deltaRzP1.1. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7. .19

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ઠે
                                                                                                                                 This is the nucleotide sequence of a trans-acting antigenomic delta ribosyme of the invention. This ribosyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the base pairs to 6 nucleotides 3'-th chaining portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate nucleotide sequence at a specific cleave viral RNA or RNA causing for example an inherited disease. The

This is the nucleotide sequence of ribozyme deltaRzP1.2. This ribozyme cleaves substrate SP1.2 (see AAZ57634). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.2) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate nucleotide sequence at a specific cleavage site of the substrate of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, blottechnological and diagnostic applications. Note: This sequence is not shown in the specification, but has been derived from the clearary.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytostatic; virucide; dengue virus; recombinant replicon; deletion; 4 protein; C protein; NS1 protein signal; vaccine; cervical cancer; al disease; antigen; dendritic cell; immune response;

The sequences given in AAQ86167-81 are primers which were used in the generation of plasmid DNA which initiates Sindbis infection. The amplified DNA sequences were used in the construction of a cukaryotic layered vector initiation system (ELVIS) derived from Sindbis. ELVIS's comprise a 5 sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevenced, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral
                                                               The invention relates to a recombinant Japanese encephalitis B virus constructed from encephalitis B virus and a recombinant genome, where the genome is inserted with an exogenous nucleotide sequence for recombination and capable of retaining its esquence for virus is useful in producing the bivalent vaccines for preventing and treating Japanese (B) encephalitis and hepatitis B. Such vaccines are producible at low cost and have high immunoefficiency, in which the recombinant virus can efficiently express the antigen of hepatitis B virus with the safety and immunogenicity of attenuated encephalitis B virus vaccines. The current sequence represents a PCR primer used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryotic layered vector initiation system; Sindbis; alphavirus; PCR; transcription initiation; non-structural protein; subgenomic fragment; RNA polymerase recognition sequence; ELVIS; gene therapy; amplify; primer; polymerase chain reaction; cystic fibrosis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                           sequence for preM protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of NSI protein signal; coding regions of all non-extructural proteins. The Obtained vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can efficiently express antigen in infected calls, which is because dengue virus can infect dendritic cells, and can effectively present antigen to provide immunity effect. Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a genecapressing system using of the full-length dengue virus cDNA clone (PRS/FLD2). The recombinant virus vectors were transfected into baby hamster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell lines. This sequence corresponds to an oligonucleotide used in the recombinant replicon of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

These vectors are eukaryotic layered vector initiation systems (ELVIS) derived from Sindbis. ELVIS's comprises a 5' sequence capable of initiating transcription of an alphavirus, a nucleotide sequence encoding alphavirus non-structural proteins, a viral junction region which has been inactivated such that viral transcription of the subgenomic fragment is prevented, and an alphavirus RNA polymerase recognition sequence. Inactivation of the viral junction region prevents transcription of the subgenomic fragment making vectors such as this suitable for a wide variety of applications, eg. gene therapy for the treatment of cystic fibrosis. (Updated on 25-WAR-2003 to correct PN field.)
junction region prevents transcription of the subgenomic fragment making vectors such as this suitable for a wide variety of applications, eg. gene therapy for the treatment of cystic fibrosis. (Updated on 25-MAR-2003 to correct PN field.)

primer HDV17-68 (AAT31151) is based on hepatitis delta virus (HDV) nucleotides 839-887. It was used with reverse primer HDV49-XC (AAT30850) for the PCR amplification of HDV sequences. A second primer pair, SIN-HDV (AAT31152) and SIN276-SPE (AAT31153), is used to amplify a fragment conty. Sindbis 5'-end sequences fused to HDV sequences. Overlapping synthesis is used in a second round of PCR using primers HDV49-XC and SIN276-SPE. The resulting construct contains the expression cassette elements HDV ribozyme/Sindbis 5'-end 299 nts/Sindbis junction region, designated pd5'26s. This was inserted into pcDNA3. Packaging cell line cassettes were constructed that allow inducible expression of

PCR primers AAV42367-420 and AAV42422-54 are used in the course of the invention. The specification describes a DNA alphavirus structural protein expression cassette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene, where the promoter directs the the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytotoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             DNA alpha: virus structural protein expression cassettes - for producing
                                                                                                                                                                                                                  DNA alpha:virus structural protein expression cassettes - for producing recombinant alpha:virus particles.

It was used with nested primer HDVI7-68 (AAM10817) and reverse primer SHDV84R (AAM10818) to generate an HDV ribozyme. This antigenomic ribozyme can be placed between the polyA tract at the 3' end of a Sindbis virus-based eukaryotic layered vector initiation system, ELVIS, and the transcription terminal signals to produce alphavirus expression vectors useful in methods of gene therapy and for vaccine produ

The specifiaction describes an eukaryotic layered vector initiation system. based on Sindbis. The eukaryotic layered vector initiation system comprises a eukaryotic promoter 5 of viral cDNA which initiates, in a susceptible target cell, 5 to 3' synthesis of RNA from the viral cDNA. The RNA comprises a vector construct which autonomously amplifies in the cell and expresses a heterologous nucleic acid sequence which encodes an antigen or modified form that eliminates an immune response within an antigen by introducing the vector into target cells, preferably by infection in vivo, especially where the immune response is a cell mediated, HLA class I-restricted or an HLA class II-restricted immune response. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bukaryotic layered vector initiation system - containing eukaryotic promoter and heterologous antigen coding sequence, useful for stimulating

                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                         PCR primers AAV42367-420 and AAV42422-54 are used in the course of the invention. The specification describes a DNA alphavirus structural protein expression casette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytotoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and stimulate an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bukaryotic layered vector initiation system - containing eukaryotic promoter and heterologous antigen coding sequence, useful for stimulating

The RNA comprises a vector construct which autonomously amplifies in the cell and expresses a heterologous nucleic acid sequence which encodes an antigen or modified form that stimulates an immune response within an animal. The system is useful for stimulating an immune response to an infection in vivo, especially where the immune response to an entided in the class I restricted or an HIA class I restricted or an HIA class II-restricted immune response.
                                                                                                                                   Gaps

                                                                                                                                                       ઠે
```

PCR primers AAV70745-46 are used to amplify part of the hepatitis delta virus (HDV) genome. The amplified product is used in the production of the alphavirus vector constructs of the invention. These constructs comprise a promoter 5' of viral cDNA which initiates the synthesis of RNA from the viral cDNA by in vitro transcription, followed by a 5' sequence sequence encoding alphavirus nonstructural proteins, a viral junction region which has been inactivated such that viral transcription of a subgenomic fragment is prevented, an internal ribosome entry site or a subgenomic fragment is prevented, an internal ribosome entry site or a sequence which promotes ribosome read through between adjacent reading frames, and an alphavirus RNA polymerase recognition sequence. The recombinant alphavirus vectors can be used for gene therapy. (Updated on 20-MAR-2003 to correct PR field.)

Alphavirus vectors constructs containing a 5' promoter of viral cDNA by in vitro transcription - used in gene therapy.

Sequence 50, Application US/09328925
Patent No. 6610906
GENERAL INFORMATION:
APPLICANT: Kurachi, Kotoku
APPLICANT: Kurachi, Sumiko
TITLE OF INVENTION: Use Thereof
FILE REFRENCE: UW-03603
CURRENT APPLICATION NUMBER: US/09/328,925
CURRENT FILING DATE: 1999-06-09
NUMBER OF SEQ ID NOS: 84
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 50
LENGTH: 11725
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 15.8; DB 4; Length 11725; Pred. No. 1.5e+02;

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

/clone="PCR was performed on DNA from Arabidopsis thaliana plants (T1) which were transformed with the T-DNA from vector pAC106 (GenBank accession number: AJ537513). The lines contain one or more T-DNA insertions. The DNA from recent (s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion.
T-DNA derived sequences were removed."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CR183540 150 DNA linear GSS 06-JUL-2004 Forward strand read from insert in 5'HPRT insertion targeting and chromosome engineering clone MHPN121h03, genomic survey sequence.

Laboratory Mouse DNA Resource
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pwD42 (gi|4732114|gb|AP129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XI10-Gold (Stratagene) cells
and selected for ampicillin registance."

/note="Organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamHi, Site 2: BglII; RescueMu is a 4.9 kb modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zamdb.iastace.edu' and follow the links for 'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA was extracted from leaf strips, double digested using BamHI and BglII, and ligated to form circular plasmids. DHIOB calls were transformed and then screened on LB plates with ampicillin."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Submitted (31-MAR-2004) Weisshaar B., Max-Planck-Institut fuer Submitted (31-MAR-2004) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln. 50829. Germany This sequence has been recovered from the fit border of the T-DNA. It indicates an insertion close to or within gene At2g34400. Details on the protocols used for generation of the Sequence are described in References 1-3. The sequences are generated at the MPI Gor Plant Breeding Research in the context of the GABI-Kat project (GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SOURCE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gelectrophoresis. Vector DNA was prepared from a derivative of pwM92 (gilly 4732114 [gb] AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll X110-Gold (Stratagene) cells and selected for ampicillin resistance."

11 Indicates an insertion close to or within gene At5g24260.

12 Indicates an insertion close to or within gene At5g24260.

13 Details on the protocols used for generation of the sequence are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project

12 GABI-Kat is part of the German Plant Genomics program designated

13 MARI-Kat is part of the German Plant Genomics program designated

rosids, eurosids II, Brassicales, Brassicaceae, Arabidopsis.
each of which contains one or more TDNA insertion elements. The resultant fragment for each line was directly sequenced to determine the genomic sequence at the site of insertion. Details of the protocols used can be found at http://signal.salk.edu/tdna_protocols.html"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Li,Y., Robbo,M.G., Strizhov,N., Viehoever,P. and Weisshaar,B. GAB1-Kat SimpleSearch: a flanking sequence tag (FST) database for the identification of T-DNA insertion mutants in Arabidopsis thaliana
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /clone="GK-184G03-013649"
